

Befehle ausführen (Docker Compose)

The docker entrypoint script sets up environment variables required by Zammad to function properly. That is why calling `rails` or `rake` on the console should be done via one of the following methods:

Bevor diese Befehle ausführen, muss das Verzeichnis zum Docker Compose Project gewechselt werden!

Directly execute a specific command:

```
$ docker compose run --rm zammad-railsserver rails r '...your rails command here...'
```

Run the interactive rails console to manually enter Rails commands:

```
$ docker compose run --rm zammad-railsserver rails c
```

Via 'docker exec':

```
$ docker exec zammad-docker-compose-zammad-railsserver-1 /docker-entrypoint.sh rails r '...your rails command'
```

If you need to retrieve information from the rails server, you can place for example `pp` (pretty print) in front of your rails command. This leads to an output in your terminal.
